

## Chain Adjuster Fitting Instructions

**Please note:** These instructions are not model specific, some minor variations may exist between different chain adjuster models.

**Please note:** We recommend the MonkeyBones Chain Adjuster be installed by a professional motorcycle mechanic only. We will not be held liable for any damage, injury or loss caused due to improper fitting.

1. Make sure the bike is safely mounted on a rear stand and remove rear axle.
  2. If possible chock the wheel in place so that the axle hole is still aligned with the swingarm holes, this will help with aligning the chain adjuster later.
  3. Remove Factory Adjuster Bolts (3) from both sides of the swingarm.
  4. Clean area around the swingarm where the chain adjuster is to be installed with a clean cloth to remove any debris.
  5. Loosen the 2 Main Body Screws (2) on each Chain Adjuster.
  6. Slide the Chain Adjusters into place and re-install and tighten the Factory Adjuster Bolts (3). You may need to remove and re-fit the Factory Adjuster Bolt Cover and Screws (4) to do this, and apply Thread Locker to them.
- Note:** Some model bikes do not have Factory Adjuster Screws (3) in the same position as seen in the image below so there may be some minor variations in the Chain Adjuster for your model bike.
7. Apply a small amount of Thread Locking glue to the Main Body Screws on both Chain Adjusters and tighten.
  8. Using a 6mm allen key, turn the Chain Adjust Screw (1) on both Chain Adjusters until the axle carriers in the Chain Adjusters have aligned with the axle hole in the wheel (if still installed).
- Note:** Each click of the Chain Adjuster Screw is approximately 0.3mm
9. Re-insert the axle and install the axle nut loosely using supplied spacer if required.
- Note:** spacer not supplied/required in all kits.
10. Adjust Chain Adjuster Screw until desired chain tension is achieved and both sides are even and tighten the axle nut to manufacturers specifications.

This product is recommended for racing use only.
